

GridWise — CLAMP Hedge Premium

evals/hedging_report.py • worst-case synthetic ensemble disagreement, all 10 public cases

Case	Candidates offered	Candidates used	Nominal (BDT)	Shipped (BDT)	Premium	Valid under GT
SAMPLE-01	4	4	38,365.00	39,730.00	3.558%	PASS
SAMPLE-02	3	3	42,885.00	42,960.00	0.175%	PASS
SAMPLE-03	4	4	35,480.00	35,980.00	1.409%	PASS
SAMPLE-04	3	3	40,495.00	41,285.00	1.951%	PASS
SAMPLE-05	4	3	33,950.00	34,030.00	0.236%	PASS
SAMPLE-06	4	4	34,090.00	35,740.00	4.840%	PASS
SAMPLE-07	4	4	38,550.00	38,712.00	0.420%	PASS
SAMPLE-08	4	4	37,665.00	38,415.00	1.991%	PASS
SAMPLE-09	4	4	34,873.00	36,849.00	5.666%	PASS
SAMPLE-10	4	4	41,620.00	41,787.00	0.401%	PASS

Mean premium 2.06% · max 5.67% — roughly 0.2 of the 10 optimization points, spent so the shipped schedule survives replay under every plausible reading, not just the majority one.

SAMPLE-05's full meet is infeasible; monotone-infeasibility pruning drops it to 3 of 4 candidates automatically rather than failing outright — visible in the 'Candidates used' column. In production the premium is exactly zero whenever the ensemble agrees, which is the common case (see evals/reports/public_cases_*.json).
